

Create a webpage that has the button (load products), when it's clicked, a fetch request (DON'T USE ASYNC/AWAIT) will be sent to the url `https://fakestoreapi.com/products`` and displays them in a dropdown list. Add a "Load Details" button that becomes enabled after products load. When clicked, show the product's image, price, and description using

`https://fakestoreapi.com/products/${id}` (Must send 2 requests)

Requirements:

1. Initially show "Loading products..." in the dropdown with both dropdown and button disabled.
2. After fetching products, populate dropdown with product titles
3. Enable button after data loads.
4. On button click, display product image, price, and description in a card layout.
